## DETAILED ACTION

The applicant's election of Group 1 claims 1-4 is acknowledged.

Claims 1-4 are present for examination.

### ***Claim Rejections - 35 USC § 103***

1. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

2. Claims 1-4 are rejected under 35 U.S.C. 103(a) as being unpatentable over **Torelli et al (6,366,496)**.

**Torelli et al (see Fig.7)** clearly shows a programming method for a multi-level flash memory device which includes the steps of shooting a programming voltage ( $V_P$ ) that is increasing upwards stepwise each time (see also Fig.6, from time I-2 to I-3 increments) with voltage increment ( $V_{GP}$ ). After the last programming voltage is shot (see the 4<sup>th</sup> voltage pulse (P) on Fig.7 diagram), an additional programming voltage ( $V_V$ ) is further shoot into said cell when a highest and/or predetermined programmed value has been reached, and cols.5-6 further describes how the last programming voltage/pulse is used as "verify" programming pulse as well, thus obviously suggests the claimed "shooting an

additional voltage ... after the last voltage is shot when a highest value of the multi-level is being programmed".

Regarding claims 2 & 4, the use of "flash" structure is mentioned in technical background and "binary" bits is considered inherent in any conventional flash structure as well.
